brew install openssl mkcert dnsmasq

HTTP

```
npm init -y
npm i -D webpack webpack-cli webpack-dev-server
npx webpack-dev-server
```

HTTPS

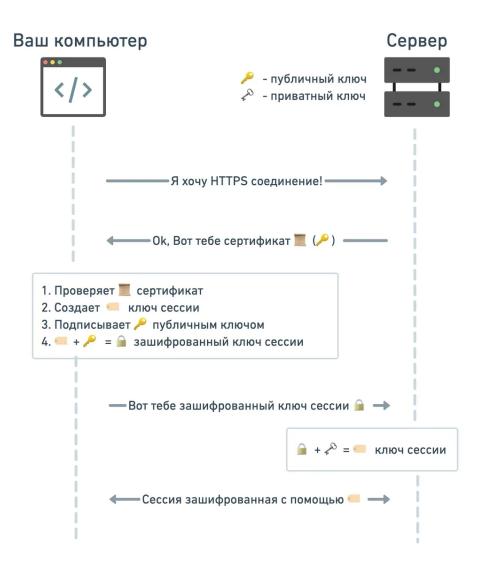

HyperText Transfer Protocol Secure

Man in the middle

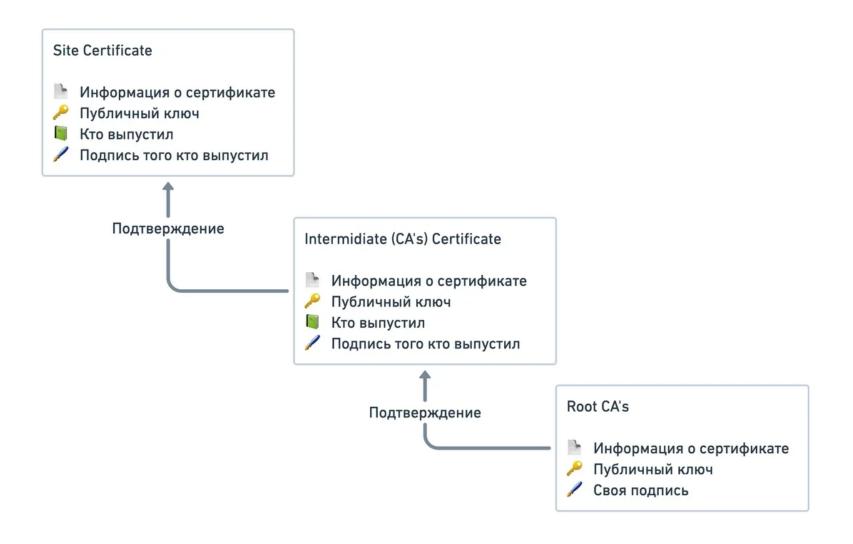

Как это работает?

Как проверяется сертификат?

Свой Root Certificate Authority

jamielinux.com/docs/openssl-certificate-authority/

Сгенерировать ключ

openssl genrsa -out rootCA.key 2048

Сгенерировать Root CA сертификат

```
openssl req -x509 -new -nodes -sha256 -days 1024 \
-key rootCA.key \
-out rootCA.pem
```

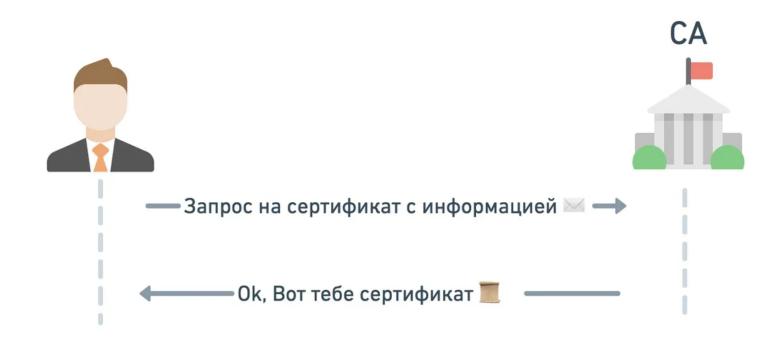

Устанавливаем Root CA сертификат в систему

Firefox

NODE_EXTRA_CA_CERTS

github.com/certifi

Создаем ключ для сертификата сайта и запрос на его создание

Генерируем ключ

openssl genrsa -out server.key 2048

Сертификат на несколько доменов

openssl-csr.conf

```
[req]
default bits = 4096
req extensions = req ext
distinguished name = req distinguished name
[ req ext ]
basicConstraints = CA:FALSE
keyUsage = nonRepudiation, digitalSignature, keyEncipherment
subjectAltName = DNS:localhost, DNS:app.localhost, DNS:*.app.
[ req distinguished name ]
countryName
                             = Country Name (2 letter code)
stateOrProvinceName
                             = State or Province Name (full r
localityName
                             = Locality Name (eq, city)
organizationName
                             = Organization Name (eg. company
```

Создаем запрос для сертификата доменов

```
openssl req -new -key server.key \
-config openssl-csr.conf \
-reqexts req_ext \
-out server.csr
```

Подтверждаем запрос на несколько доменов своим RootCA

```
openssl x509 -days 500 -sha256 -req \
-set_serial 01 \
-extfile openssl-csr.conf \
-extensions req_ext \
-in server.csr \
-CA rootCA.pem \
-CAkey rootCA.key \
-CAcreateserial \
-out server.crt
```

Проверяем

А можно проще?

certificatetools.com

mkcert

github.com/FiloSottile/mkcert

```
mkcert -install
mkcert localhost app.localhost '*.app.localhost'
```

SSL Termination

nginx_localhost.conf

```
server {
  listen 443 ssl;
  server name ~^(?<local port>\d+)\.app\.localhost$;
  ssl certificate /YOUR PATH/server.crt;
  ssl certificate key /YOUR PATH/server.key;
  location / {
   proxy pass http://127.0.0.1:$local port;
   proxy_set_header Host $host;
   proxy set header X-Real-IP $remote addr;
   proxy set header X-Forwarded-For $proxy add x forwarded 1
   proxy set header X-Forwarded-Proto $scheme;
   proxy set header X-Forwarded-Host Sserver name:
```

caddyserver.com

github.com/typicode/hotel

Local DNS

dnsmasq

/usr/local/etc/dnsmasq.conf

listen-address=127.0.0.1
conf-dir=/usr/local/etc/dnsmasq.d

```
mkdir -p /usr/local/etc/dnsmasq.d
tee /usr/local/etc/dnsmasq.d/localhost > /dev/null <<EOF
address=/localhost/127.0.0.1
EOF</pre>
```

```
sudo mkdir -p /etc/resolver
sudo tee /etc/resolver/localhost >/dev/null <<EOF
nameserver 127.0.0.1
EOF</pre>
```
